SmartKey Locker® Touch

taking today's keys into tomorrow

SmartKey Lockers are ideal for securing, managing, and tracking important assets such as laptops, cash trays, wallets, cell phones, hand-held radios, and more. Start with a single cabinet or customize your system with multiple locker solutions. Choose among radio locker modules, single-door locker modules, dual-door locker modules, and PC locker modules.

As your needs change, expand or reconfigure your system easily or add networked cabinets to strategic locations throughout the enterprise. Set up SmartKey Locker systems as secure storage space for one or multiple users. SmartKey Locker systems are engineered to be integrated with other security or business systems for optimal efficiency.

MORSE WATCHMANS

SmartKey Locker® Touch
the integrated solution with touchscreen simplicity

Cabinet Styles

product door not shown in images

Radio Locker

Single Locker Module

PC Locker

Dual Locker Modules
Accessories

Identity Access Options

Choose from card, hand or fingerprint readers, touchpads, and facial recognition access

SmartKeys

Our patented SmartKeys track users and movements with an identification chip

TrueTouch Software

Assign users, permissions, access level and more with full reports and alerts

Built-in Ethernet Port

SmartKey Locker Systems have a built-in ethernet port to connect other security and business systems on the network for maximum efficiency.

Integrations

SmartKey Locker systems have the ability to communicate across other security and business systems. By opening our protocols to a wide range of integration partners, Morse Watchmans makes it possible to implement connectivity across any systems on any level you choose.

When you integrate and synchronize your SmartKey Locker system with your access control system, the unified systems will optimize communication and improve security. For instance, a user who has taken an object from a SmartKey Locker cabinet can be denied from exiting the facility via the access control system until the object is returned.

Administrators can be set up to receive alerts automatically via email when an item has not been returned. Transaction reports for auditing purposes are available instantly and can be scheduled to be emailed to system administrators at specific times.
